Ensha | مداد فکر

Business Plan

Version 0.1 — Prepared for presentation to impact investors and cultural/educational foundations

Disclaimer

The preparation of this document (costs, pricing, revenue scenarios) is based on explicitly stated illustrative assumptions. Figures in each section are estimates and do not constitute guaranteed forecasts or formal financial/legal advice. Before any negotiation or formal investment decision, it is recommended that these figures be verified with local financial and legal advisors.

---

1. Executive Summary

Ensha | مداد فکر is a learning ecosystem for better delivery of foundational writing (Ensha/ composition) instruction in grades 4 to 6 of primary school. Unlike common "text analysis" tools that promise precision and definitive classification, Ensha | مداد فکر makes a smaller, more honest claim: to help the teacher read a few student compositions each week, not miss encouraging moments, and help students become more interested in writing as much as possible.

The proposed business model is freemium: a free version (a fixed bank of positions, without artificial intelligence) for broad, risk-free adoption, and a premium version (a complete AI cycle and class memory) for schools ready to invest in a deeper experience. AI infrastructure costs have been designed to remain low (less than $10 per active class per year).

---

2. Problem and Proposed Value

2.1 Problem

Writing (Ensha) teachers face a high volume of student compositions every week. In this volume, it is natural that encouraging points in children's writing go unnoticed — and this loses valuable opportunities to strengthen a child's interest in writing.

2.2 Proposed Value and Competitive Distinction

Ensha | مداد فکر does not claim accuracy or full automation — unlike competitors in this field. This is a deliberate choice that may seem like a market risk, but in practice it is a sustainable competitive advantage: long-term teacher trust is built not with inflated promises but with small, honest claims.

The complete explanation of this distinction appears in the "Ensha | مداد فکر Foundation" document.

---

3. Target Market and Customers

Group	Description
Primary customer	Private primary schools (grades 4-6) — greater budget and flexibility to adopt a new tool
Secondary customer	Independent teachers and Persian language/literature institutes
Long-term path	Public schools through contracts with educational institutions (longer sales cycle, larger scale)
Preferred financial partners	Impact investors and cultural foundations — due to mission alignment, not just financial return

Key decision: The real customer is the school (purchased organizationally — the student or family is not considered directly); the teacher is the daily end-user; the school principal is the purchase decision-maker.

---

4. Product Model: Free and Premium Versions

Purchase unit is a "class," because it directly correlates with the architectural unit of knowledge (class memory) and enables pricing proportional to the school's real scale.

---

5. Revenue Model and Proposed Pricing

Main model: Annual subscription per active class. The figures below are proposed, adjustable with local market research.

Price range (per class, monthly)	Target	Note
500,000 to 1,000,000 Toman	Initial pilot / small schools	Entry price to build initial trust
1,000,000 to 2,000,000 Toman	Medium to large private schools	Proposed standard price
Agreement / annual license	Large schools or chains	Volume discount for higher class count

Optional supplement: Given that revenue is not the founder's main motivation, a "minimum cost recovery" model (no profit margin, only covering real API and infrastructure costs) is also considered as an option to offer to supporting foundations.

---

6. Cost Structure

6.1 AI Costs (variable, dependent on real usage)

Component	Annual Estimate (per class)	Explanation
Discovery engine	≈ $8	Largest cost share; runs weekly per student
AI Composer	≈ $0.7	Stronger model, but runs only once per week
Suggestion engine	≈ $0.1	Simple logic, nearly no cost
Total (approx.)	**≈ $9 per year**	With Prompt Caching, practically less

6.2 Infrastructure and Hosting

By choosing services with free-to-paid plans on the same architecture (such as Supabase and Railway), the cost at a scale of hundreds of classes is estimated at less than $100 per month; in the pilot phase (under 10 classes), this cost is practically negligible or zero.

6.3 Software Development (one-time cost)

The largest real cost of the project is the initial development (MVP) — not ongoing infrastructure cost. This cost depends on team composition, duration, and usage time; the exact figure must be estimated against the local specialized labor market (see Section 9 for the proposed team composition).

---

7. Unit Economics

Assuming an average price of 1,500,000 Toman per month per class (= 18,000,000 Toman per year) and an AI cost of about $9 (≈ less than 500,000 Toman per year per class), the gross margin per active class is estimated well above 95%.

The main cost is development and customer acquisition, not ongoing service delivery — a desirable feature in SaaS models. This calculation is sensitive to

exchange rate and domestic inflation and must be updated at the time of a real presentation to investors.

---

8. Sample Growth Scenario (Three Years)

The table below is a sample and entirely hypothetical scenario, purely to demonstrate the model's scalability — not a definitive forecast.

Year	Pilot/Client Schools	Active (Premium) Classes	Approx. Annual Revenue
Year 1	3 to 5 (mostly free pilot)	10 to 15	Negligible or zero (validation phase)
Year 2	10 to 20	50 to 80	≈ 900 million to 1.4 billion Toman
Year 3	30 to 50	200 to 300	≈ 3.6 to 5.4 billion Toman

---

9. Requirements and Needed Team

9.1 Minimum Team for MVP/Pilot Phase

- One full-stack developer (backend + frontend)
- One primary education specialist / experienced teacher (even part-time or advisory)
- The founder as overall architect and coordinator

9.2 Additional Roles in the Growth Phase

- UX/UI designer (critical, since the interface must be simple for non-technical teachers)

- School liaison / sales & business development
- Part-time legal advisor (children's data privacy)

---

10. Go-to-Market Path

- **Phase 1 — Pilot:** 2-3 schools, free or symbolic, full cycle test, and real feedback collection
- **Phase 2 — Validation:** 5-10 schools, start limited sales, adjust engines based on real data
- **Phase 3 — Growth:** Active sales to private schools, possibly premium for independent teachers as an entry channel
- **Phase 4 — Scale:** Negotiations with larger institutions (Ministry of Education, school networks, cultural foundations)

---

11. Risks

Risk	Description and Mitigation
Teacher cultural resistance	Need for training and proof of "partner" (not "replacement") role; free pilot to build trust
Long sales cycle in public sector	Initial focus on the private sector, which decides more agilely
Limited market (Persian language niche)	Accepted deliberately; depth of impact in this market is more important than immediate global scale
Dependence on initial data quality	If sufficient evidence is not gathered in the first terms, the value of the suggestion engine emerges later; expectation management in the pilot phase

12. Conclusion and Request

Ensha | مداد فكر seeks seed funding to cover the pilot phases (Phases 1 and 2, in Section 10): mainly the cost of MVP development and the minimum team salary for one to two years. Given the high gross margin and low ongoing cost (Section 7), this project can move toward financial sustainability at a relatively high speed after passing the validation phase — without the need for large, repeated funding rounds.

End of document. This is version 0.1; before official presentation, the figures require review with real market data.
