An Invitation to Invest in a Learning Ecosystem

Investment Proposal — Version 0.1

Ensha is not after perfection in understanding the class; it is after ensuring that the teacher loses fewer moments that deserve encouragement, and that the student who is seen comes to love writing a little more.

The Starting Point

One teacher, one composition (enshā) class, every week. In thousands of composition classes, a teacher sits and has to read thirty students' compositions. Time is scarce, the fatigue is real, and in the midst of all that volume, it is natural that sometimes a good sentence, an unexpected idea, or the small effort of a child passes by unnoticed, without having been seen. **Ensha was built for precisely that moment.**

What Is Ensha?

Ensha is a **learning ecosystem** for composition classes in the fourth through sixth grade of elementary school — **not** a content production tool, **not** a grading system, and **not** a text analysis tool.

Ensha helps the teacher not to lose the encouragement-worthy moments in students' writings, and helps children to experience writing as something **seen and valuable**.

The project's goal is not to cultivate *better writers*; rather, it is to cultivate a **thinking mind** — a mind that asks, that looks at things from different angles, that discovers connections between things, and that, instead of repeating ready-made answers, goes after deeper understanding. These are mental

habits that, on the very platform of the composition class itself, slowly and without any direct instruction or imposed content, take shape.

Why This Is Different

The market of AI-based educational tools is full of products that promise "precision" and "automatic analysis." **Ensha deliberately distances itself from this path:**

Common text analysis tools	**Ensha**
Claim high precision in diagnosis and grading	Produce cheap and abundant hypotheses
Claim certainty; the output can replace the teacher's judgment	Never; the output only draws the teacher's attention to one point
Success = high statistical accuracy	Success = how many students were truly seen and felt encouraged
This small claim is not a weakness — it is the project's durable competitive advantage.	

Tools that promise perfection usually lose trust when they come up against the reality of a real classroom; Ensha, with a smaller and more honest claim, builds more lasting trust.

The Competitive Advantage: A Memory That Grows Over Time

The core of Ensha's value is the **"class memory"**: a gradually built, evidence-based understanding that grows richer with every session. The more a class uses Ensha, the more precise and appropriate its recommendations become — and switching to a competitor would mean **surrendering this accumulated history**. This is exactly the kind of competitive advantage that *strengthens* over time, not weakens.

The Business Model at a Glance

- **Free tier:** A fixed bank of 100 educational situations, **without** artificial intelligence, **without** data storage — a risk-free entry channel for schools and teachers.
- **Premium tier:** The full AI cycle and class memory, with a **"class"** purchase unit — an annual subscription, aligned with the reality of schools' scale.
- **Target customer:** Private elementary schools (with the purchase decision-maker, and the teacher as the daily user).
- **Preferred financial partners:** Impact investors and cultural/educational foundations, because of mission alignment.

Project Economics: Margin Note

High margin, low running cost. The AI cost per active class — thanks to smart tiering of models (using the simplest sufficient model for each task) — is estimated at **around $9 per year** — a figure that, with optimization techniques, could become even lower.

Component	Annual estimate (per class)	Note
AI cost	≈ $9	Low, thanks to smart model tiering

The gross margin is estimated at more than **95%** against the proposed annual subscription pricing. The largest real cost is **initial development (one-time)**, not ongoing infrastructure or AI costs. In other words, the capital raised will be spent mainly on **passing through the validation phase and building the product** — not on covering endless running costs — a desired feature for any investor seeking a clear path to financial sustainability.

Roadmap

- **Phase 1 — Pilot:** Two to three schools, complete testing, real feedback-collection cycle.
- **Phase 2 — Validation:** Five to ten schools, sales begin, limited refinement of the engines based on real data.
- **Phase 3 — Growth:** Active sales to private schools; possible opening of a premium channel for independent teachers.
- **Phase 4 — Scale:** Discussions with larger educational and cultural institutions for broader reach.

Why This Approach Is Reliable

Ensha is built on three foundations that are rarely seen in similar products:

- **Epistemic humility:** No AI output is presented as absolute truth; everything is a revisable hypothesis.
- **Precise boundaries:** The project never enters into personality analysis, ranking, or predicting the future of children — the project's strength comes precisely from these clear boundaries.
- **Evidence-based design:** Every technical decision is rooted in a citable, documented principle; the project has been designed from day one for gradual growth and continuous improvement, not for claiming perfection from the outset.

The Request

Ensha seeks an investment that will cover **Phases 1 and 2** (Pilot and Validation): mainly the cost of developing the initial version and the salaries of a minimal team for one to two years. Given the economics note above and the low running cost of this model, the project is expected, after passing these phases, to move toward financial sustainability **without the need for successive large funding rounds**. Complete details of the finances, team requirements, and risk analysis are available in the **"Ensha Business Plan Document."**

An Invitation to Conversation

Ensha is a project that came out of a **real need** in the classroom, not out of an abstract idea. If you believe that investing in how a generation **thinks** carries value beyond ordinary financial return, we invite you to start this conversation.

Ensha's power is not in producing intelligent answers; it is in creating a cycle that turns every session into an opportunity for a better session.
