Ensha Foundation Document

Why Ensha Is Not a Text Analysis Tool

Version 0.1 · Elaboration and replacement of the "Zero Principle" — the foundational law of Ensha

---

About this document: This document is the principal reference for understanding the concerns, goals, and success criteria of Ensha. After this, the document should refer to the "Zero Principle" — the foundational law; what is elaborated in what follows is precisely that same foundational sentence, not something separate beside it.

---

1. The Starting Point

Imagine a "composition class" (enshā) teacher who has to read more than thirty compositions every week. Time is scarce, the fatigue is real, and amid this volume it is natural that sometimes a good sentence, a clever point, or the small effort of a child passes by unnoticed, without having been seen.

Ensha was built for precisely that moment: to help the teacher lose such moments less often, and to help the students, whose writing is seen and encouraged, gradually become more fond of writing. That — and no more. The project's goal is not ambitious; precisely for this reason it is achievable.

---

2. What Ensha Is Not

In the market of educational tools, a large category of products promises to "analyze" or "evaluate" educational text — with claims of precision, definitive classification, and sometimes replacing part of the teacher's judgment.

Ensha deliberately distances itself from this category:

Conventional educational text analysis tools	**Ensha**
Claim high precision in diagnosis/grading	Produces cheap and abundant hypotheses
Claim certainty; the output can replace the teacher's judgment	Never; the output only draws the teacher's attention to one point
Goal: correct classification of every text	Goal: not letting a good moment be lost
Success = high statistical accuracy	Success = how many students were truly seen and felt encouraged
Error costs the system's credibility	Error simply fades in color and remains harmless

This distinction is not marketing rhetoric; it is directly woven into the project's technical architecture — from the removal of the OCR and model, to the rewarding of hypotheses.

---

3. The Real Success Criterion

In a class of thirty, if even seven or eight students, because of this attention from the cycle of recognition, become somewhat more interested in writing, Ensha has achieved its goal.

This sentence may seem like a modest claim; but it is precisely this modesty that makes it executable, honest, and sustainable. Ensha does not promise perfection — because perfection in understanding a class is unattainable even with the most advanced technology. Ensha promises tangible improvement.

---

4. Abundant Hypotheses, Not Precise Diagnosis

The Ensha discovery engine does not have the task of "correctly" diagnosing a thinking movement in a text with high probability. Its task is this: to turn every trace, every sign — even weak and uncertain ones — into a plausible hypothesis and place it before the teacher's view.

This approach is deliberately "liberal," not cautious:

- **It is better to build ten hypotheses of which three turn out to be real** than to miss another real opportunity by producing two "confident" hypotheses.
- **No hypothesis is punished.** A hypothesis that is wrong or irrelevant simply never receives any confirmation from the teacher and fades over time — not that it is deleted or crossed out from the start.
- **There is no negative score in this architecture.** A hypothesis is never declared "invalid" or "rejected"; it can only fade in color.

It is precisely this principle that takes the heavy burden of "high precision" off artificial intelligence and transfers it to where it is more appropriate: the gradual and human judgment of the teacher over time.

---

5. The Two Roles of the Discovery Engine

In order for this philosophy of action to remain simple, the discovery engine has two completely separate roles that must not be mixed:

- **The main, daily role:** From among each week's compositions, it finds a few points that are truly worth encouraging and shows them to the teacher in simple language — without the need for precise classification of which thinking movement it was.
- **The secondary, background role:** It frames those same findings within hypotheses related to thinking movements, to record them for the gradual enrichment of class memory — without pressure for momentary precision.

The first role builds the teacher's daily experience. The second role, in silence and over the months, builds knowledge of the class. Neither should place the burden of the other's work on its shoulders.

---

6. Why a Small Claim Is Not a Weakness

Many artificial intelligence tools in education promise precision and complete automation. These promises usually break in the face of the reality of a real classroom and erode trust.

Ensha chooses another path: a smaller, but more honest and more sustainable claim. This choice is not a technical limitation that must be hidden; rather, it is part of the project's identity.

---

7. Statement

Ensha is not after perfection in understanding the class; it is after ensuring that the teacher loses fewer moments that deserve encouragement, and that the student who is seen comes to love writing a little more.

This sentence is the elaborated version of the "Zero Principle" — the foundational law of Ensha — and is regarded as the final reference for every design, technical, or business decision of the project.
