WRITING • THINKING • DISCOVERY

Helping teachers discover the moments that make children love writing

Pre-seed · Elementary Writing Education · Grades 4–6

Meysam Faraji, Founder — elementary school teacher

THEPROBLEM

Every missed sentence is a missed opportunity to encourage a child

Every week, teachers running the creative-writing class face dozens of student essays with little time to read closely. In that volume, it's natural for a good sentence, an unexpected idea, or a small act of courage in a child's writing to go unseen.

30+

essays a teacher reads in a single week

0

of today's grading tools leave room for doubt

1

missed sentence can be a missed reason to love writing

THESOLUTION

ENSHA helps teachers see what’s worth encouraging -without pretending to grade

ENSHA is a learning ecosystem for the weekly creative-writing class, grades 4–6 — not a content generator, not an auto-grader. It surfaces small, genuine moments worth praising, and gradually builds a picture of a classroom's growth. The teacher always makes the final call.

- **Ten writing methods** — Observation, narrative, letter, comparison, dialogue and more — each opening a different path into thought.
- **Twelve thinking movements** — Questioning, comparing, perspective-taking, revisiting — the cognitive habits we design toward, never teach directly.
- **A humble discovery engine** — Generates cheap, plentiful hypotheses about a class — never a verdict — and lets teacher feedback strengthen or fade them over time.

WHY IT'S DIFFERENT

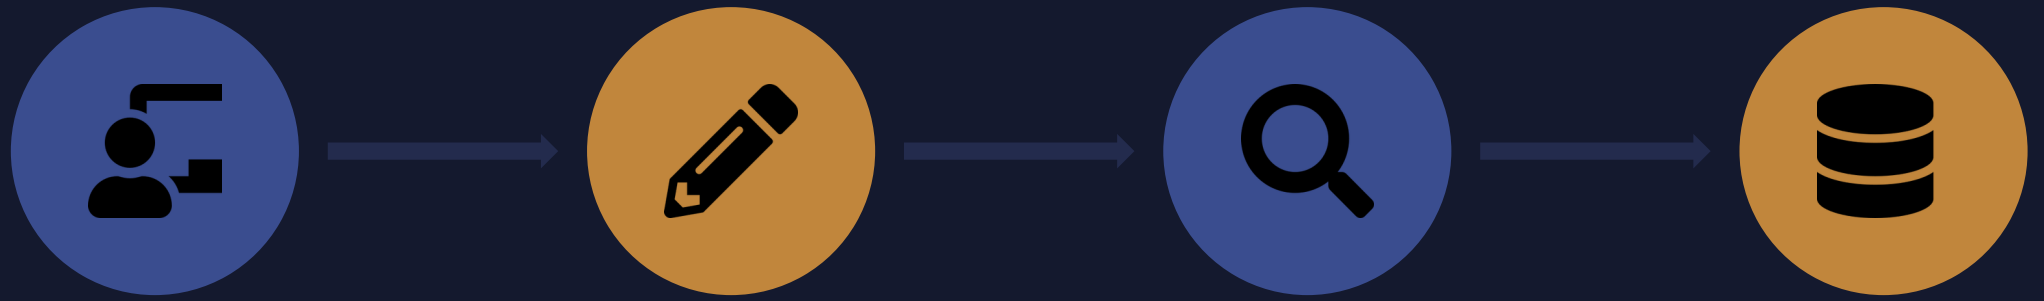

An honest smaller claim, on purpose.

Most AI writing tools promise precision. We promise something we can actually keep.

TYPICAL AI TEXT-ANALYSIS TOOLS	ENSHA
✗ Claims high-precision detection & scoring	✓ Cheap, plentiful hypotheses — never a claim of certainty
✗ Output replaces the teacher's judgment	✓ Output only points the teacher's attention to one spot
✗ Success = statistical accuracy	✓ Success = a few real students who start loving writing
✗ Error carries a cost to system credibility	✓ Error simply fades — and never counts against a hypothesis

HOW IT WORKS

A living cycle, not a one-shot analysis.

Recommend

Class memory suggests a writing method

Design

Method + prompt + limits become a real activity

Discover

Weak signals become gentle hypotheses

Remember

Teacher feedback strengthens or fades them

The loop closes: richer class memory makes next week's recommendation better — no code changes required.

PRODUCT

Free proves the pedagogy. Premium proves the memory.

FREE

- 100 ready-made teaching situations
- 10 methods × 10 situations each
- Zero AI, zero data stored
- Works for any teacher, instantly

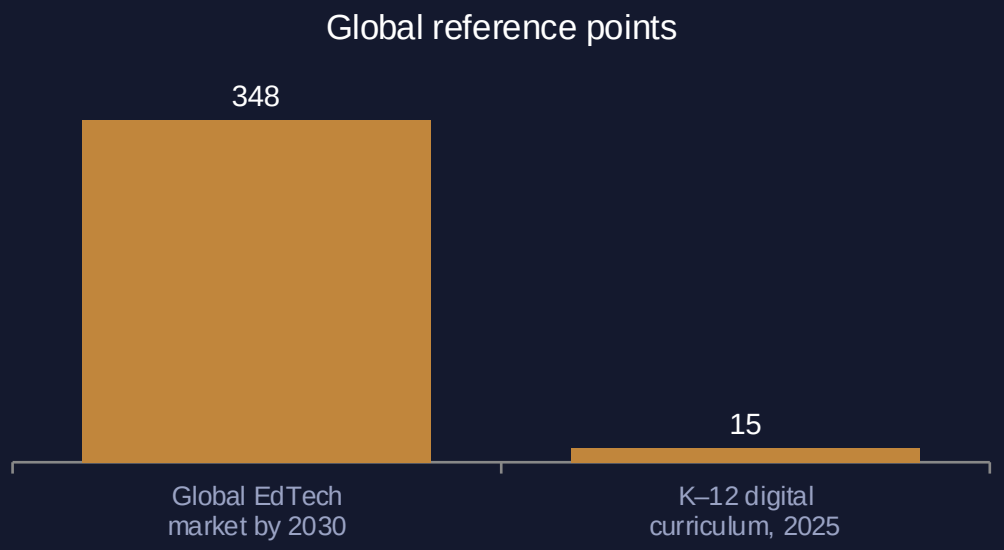

PREMIUM

- Full discovery + recommendation cycle
- Class memory that grows all year
- AI Composer designs new activities
- Billed per classroom, per year

Unit of purchase: one classroom, per year — matched to how school budgets actually work.

MARKET

A large global category, a focused first market.

Iran — our first addressable market

~3.5–4M	students in grades 4–6 nationwide
~120–130K	classrooms of ~30 students
~15–20K	classrooms in private elementary schools — our initial SAM
~750–1,000	classrooms at 5% penetration — a realistic 3-year target

Figures are illustrative estimates based on stated assumptions, not audited projections.

COMPETITIVE LANDSCAPE

Crowded with generators. Empty of humble discovery tools.

	WHAT IT DOES	THE GAP
Vira (Iran)	AI assistant that writes or improves the essay text itself	Replaces the child's own writing — the opposite of our approach
ChatGPT & generic AI	Generates full essays on request, globally and in Iran	No pedagogy, no teacher-in-the-loop, no honesty about limits
NoRedInk / Quill.org	K–12 grammar & writing platforms with AI grading assistants	Claims grading precision; built for English-language curricula

BUSINESS MODEL

High margin, low recurring cost — by design.

$9

AI cost per active classroom, per year

>95%

estimated gross margin at proposed pricing

1

unit of billing: one classroom, one year

Why the cost stays this low:

- Discovery engine only needs a mid-tier model — it finds weak signals, not certainty
- Recommendation engine is plain rule-based logic, not AI at all
- Only the Composer (creative activity design) needs a stronger model

WHERE WE ARE

Fully documented. Content complete. Ready to pilot.

13 documents

Constitution, technical architecture, data contracts, UI/UX guide, business plan

100 free situations

Fully written and reviewed across all 10 writing methods

Safeguards defined

Ideological neutrality, no personal-data misuse, teacher always in control

Pilot-ready

Seeking 2–3 schools to run the full cycle and validate the discovery engine

THE ASK

Fund the pilot. Prove the pedagogy in a real classroom.

We're raising a pre-seed round to cover Phase 1–2: a 2–3 school pilot, full validation of the discovery engine against real teacher judgment, and MVP development. Given the low ongoing AI cost and high gross margin, the project can move toward sustainability without repeated large funding rounds.

USE OF FUNDS

- MVP engineering (full-stack dev)
- Part-time pedagogy expert
- Pilot support, 2–3 schools
- Infrastructure & AI (minimal)
